SUMMARY

Senior backend engineer (5 years) building distributed, multi-tenant data platforms and streaming/observability systems at Eightfold.ai and Nutanix. Architected a metadata-driven entity platform (100+ entity types, 200+ customers) and an LLM configuration agent that cut solution turnaround from 3 days to 1 hour. MS Computer Science, Georgia Tech.

EXPERIENCE

Senior Software Engineer Feb 2025 – Present
Eightfold.ai (Data Platform), Bengaluru, Karnataka

- **Owned the runtime entity architecture** of a headless, metadata-driven talent platform (dynamic schemas, MySQL, **Solr/Lucene** search, generic CRUD and relationship APIs, **RBAC**, tenant isolation), backing **100+ entity types for 200+ customers**.
- Built an **LLM configuration agent** (tool calling, **agentic RAG** over customer schemas, macros and docs; OpenAI embeddings, Solr hybrid search) that cut solution turnaround from **3 days to 1 hour** and resolves **40%** of queries.
- Built the **Recurring Ingestion UI** and the **Custom Entity UI** (React, TypeScript), giving customers and solution teams self-serve configuration of file ingestion schedules and custom entity schemas.
- Built REST APIs serving **1M requests/day** (JWT, enriched SCIM) and owned the **CSV and recurring-file ingestion framework**; cut ingestion-failure debugging from **24–48 hrs to 1–2 hrs** with stuck-ingestion detection, per-customer alarms, dashboards and an **on-call triage agent**; drove **RCA** on **100+ production issues**, saving **10 hrs/week** with data-repair tooling.

Member of Technical Staff July 2021 – Feb 2025
Nutanix (Flow Network Security), Bengaluru, Karnataka

- Collaborated on an **entity synchronization framework** replicating security policies across 2–3 availability zones over RPC, using idempotent updates to eliminate duplicate writes.
- Scaled the visualization backend to stream **1M+ data points** via **Kafka** and WebSockets (**10x throughput**); cut memory **5%** through cgroup limit tuning measured with **Grafana**.
- Prototyped **FlowAnywhere** (Flow Network Security on VMs in any cloud via iptables) and **eBPF-based anomaly blocking** isolating VMs on port scans and SYN floods in under 1 ms. Mentored 4–5 junior engineers; worked with **Jenkins** CI.

SKILLS

Languages	Python, Go, Java, C++, SQL, C#, React, TypeScript, JavaScript
Backend & Data	REST APIs, gRPC, MySQL, Solr/Lucene, DynamoDB, Kafka (Connect, Streams), stateful services, storage systems, multi-tenant design, RBAC/JWT/SCIM, data ingestion
Infrastructure	Kubernetes (EKS), Docker, AWS (Lambda, S3, SQS, CloudWatch),Azure(Service Bus, Cosmos DB), Jenkins, GitHub Actions (CI/CD), eBPF, iptables, OVS
Systems & Reliability	Distributed systems, system design, Linux, networking, concurrency, performance tuning
Observability & Ops	Grafana, Prometheus, OpenTelemetry, CloudWatch, metrics, alerting, dashboards, load/performance and regression testing, on-call, incident response, RCA
Engineering	Technical design, code reviews, mentoring
AI	LLM agents, agentic RAG, output validation and evaluation, Reinforcement Learning, NEAT

EDUCATION

M.S. Computer Science, Georgia Institute of Technology Aug 2023 – May 2026
GPA: 3.8/4.0

B.E. Computer Science, BITS Pilani, Pilani Campus 2017 – 2021
GPA: 8.17/10.0

PROJECTS

Sharded Transactional KV Store – Exactly-once semantics, primary-backup replication, Paxos, 2PC.

DynamoDB-inspired Database – Leaderless replication, read repair, automatic partition rebalancing.

MapReduce Framework – From the OSDI '04 paper, with worker failure detection and task re-execution.
